

I want a **complete turf maintenance management system (TurfOps)**.
Starting with mowing, we can build it so it's easy to expand later.

The app could eventually have:

 **Turf & lawn areas**

 Mowing

 Irrigation

 Fertiliser & spraying

 Disease/pest management

 Machinery & equipment

 Job photos

 Job timers (not urgent)

 Automatic weather

 Automatic scheduling

 Due/overdue notifications

 Productivity & machine utilisation (Not urgent)

 Reports

- Machine usage
- Lawn history

 Cloud backup with

- iPhone support
- Android support
- Tablet support
- Secure cloud backup
- Multi-user access
- Automatic backups
- Secure login
- Syncs instantly between devices

 Multi-user access (Each staff member has their own login, but can also see what each other have done).

Phase 1

The main screens could be:

 **Dashboard** — what's due, overdue and recently mowed.

 **Lawn Areas** — all existing areas, with search.

 **Log a Mow** — select:

- Lawn area **(selectable from a list)**
- Date
- Mow length **(selectable from a list)**
- Mowing direction **(selectable from a list)**
- **Person mowed by (selectable from a list)**
- **Equipment used (selectable from a list)**
- Notes
- Optional photo
- Save button

 **Add New Lawn Area** — create a new area whenever you need to.

 **Mowing History** — see every mow recorded for each area.

Search

- Lawn
- Person
- Machine
- Date
- Mow height
- Notes

The list of selectable people and equipment mowed by / with

- | | |
|----------|--------------|
| ● Hamish | ● Noah |
| ● Steve | ● Grant |
| ● Tony | ○ Add person |
| ● Kane | |

Equipment used

- JD 9009a
- JD 1585
- JD 997
- Trimax Pegasus
- Trimax Snake
- Walker

- Toro Pro stripe
- Push mower
- JD 300r
- JD 1580
 - Add equipment

Mow length range

15-20mm	35-40mm	55-60mm
20-25mm	40-45mm	60-65mm
25-30mm	45-50mm	65mm +
30-35mm	50-55mm	

A Selectable Frequency field

Frequency options

7 -10 days

10 -14 days

14 -21 days

21 -25 days

Custom option

The app could then show something like:

- **Due today** — 3 areas
- **Due this week** — 6 areas
- **Overdue** — 2 areas

Phase 2 – Equipment

Each mower gets its own profile.

For example:

JD997

- Hours
- Service interval
- Next service due
- Repairs
- Blades changed
- Tyres
- Fuel usage

That means you can search:

"When were the blades last changed on the JD997?"

Phase 3 – Turf Management

Each lawn could also store:

- Grass species
- Fertiliser history
- Herbicide applications
- Fungicides
- Insecticides
- Irrigation
- Soil tests
- Renovations
- Aeration
- Topdressing

So five years from now you'll have a complete history for every area.

That gives me something the team can start using before spring instead of waiting for a huge system to be finished.

How I think we should move forward

Stage 1 (2–4 weeks)

Build a working app that I can install on my own phone.

It would include:

- Dashboard
- Automatic scheduling
- Lawn database
- Search
- People
- Equipment
- Mow heights (mm)
- Mowing history
- Reports

I only use it first as a "dummy run."

Stage 2

Once I am happy:

Invite Tony, Kane, Steve, Noah and Glen,

Everyone logs into the same system.

Now everyone is recording jobs.

I think this could become something much bigger
